

Ab initio description of exciton dispersion

Francesco Sottile
LSI, École Polytechnique, Palaiseau
European Theoretical Spectroscopy Facility

Psi-k Conference
Donostia - San Sebastián
8 September 2015

Excitons

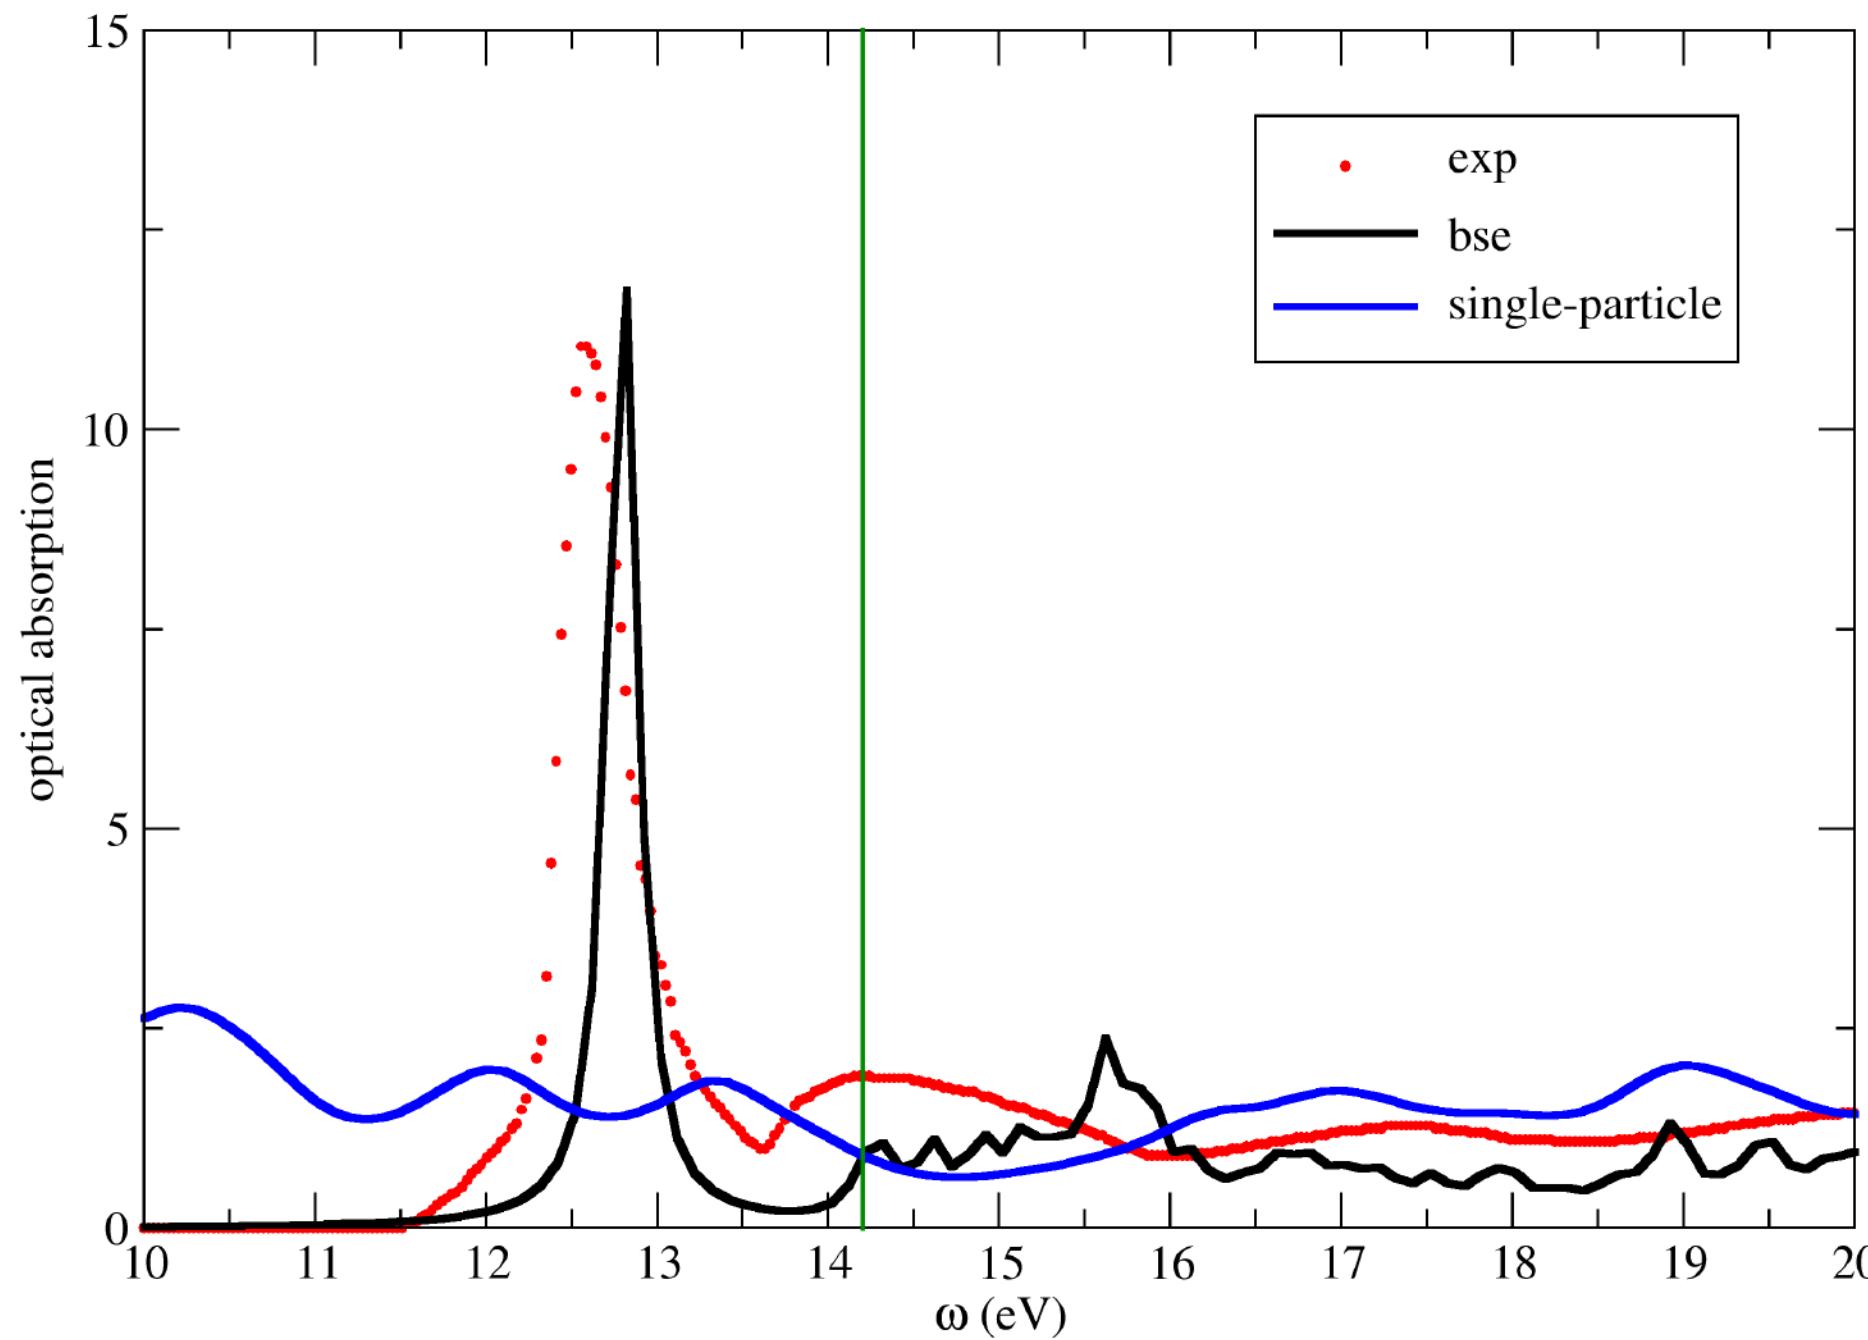

- optical properties $\epsilon(\omega)$
- ↳ material description
- ↳ applications (photovoltaics,
optoelectronics, phototherapy)

→ we need Bethe-Salpeter eq. (BSE)

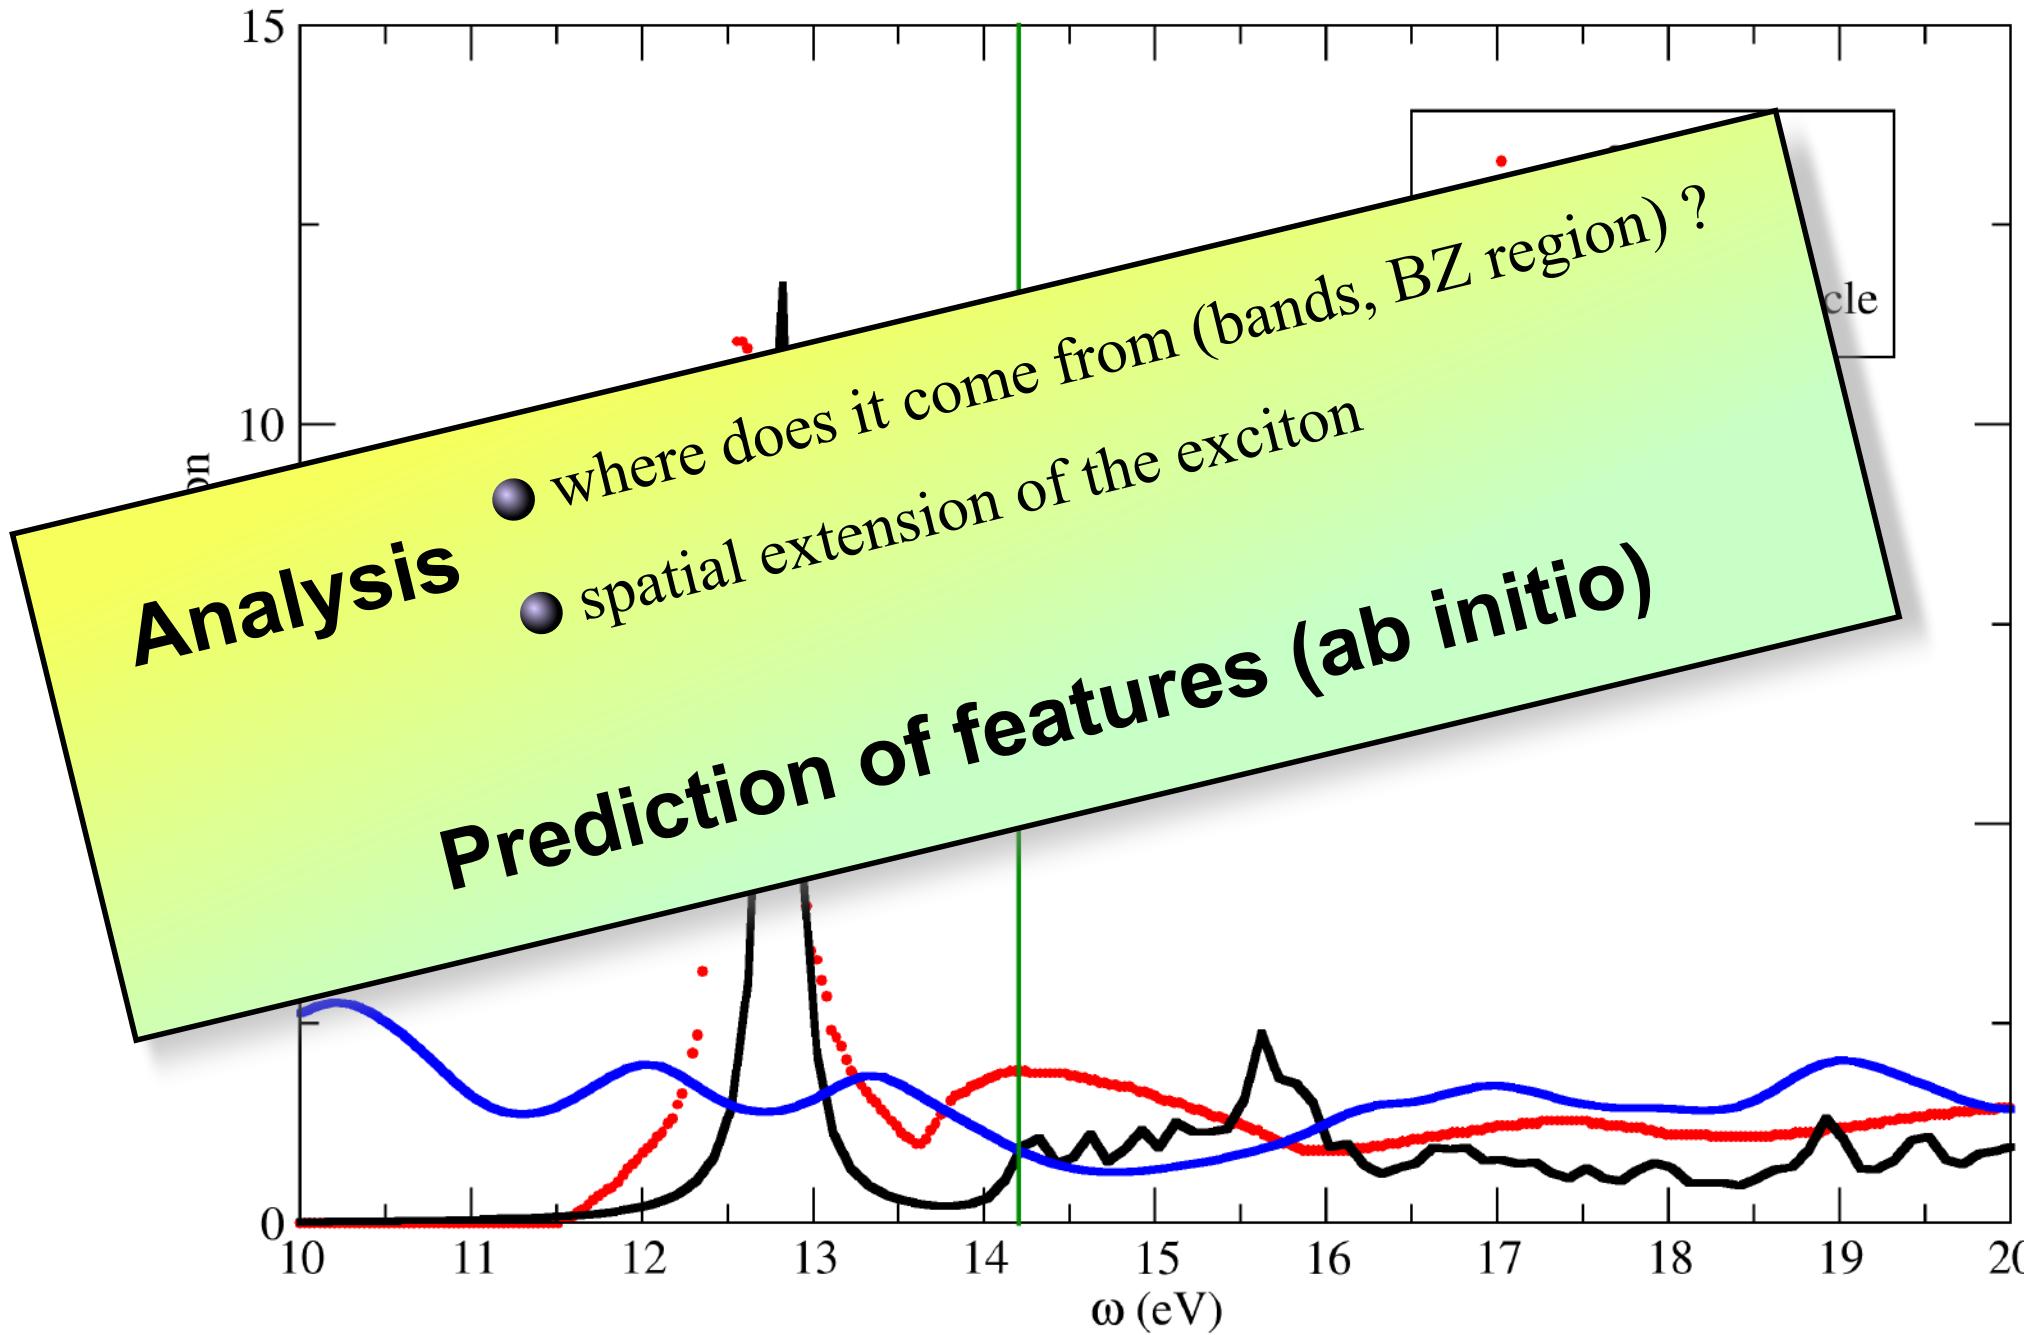

✗ cumbersome

✓ accurate
ab initio

Absorption spectrum of LiF

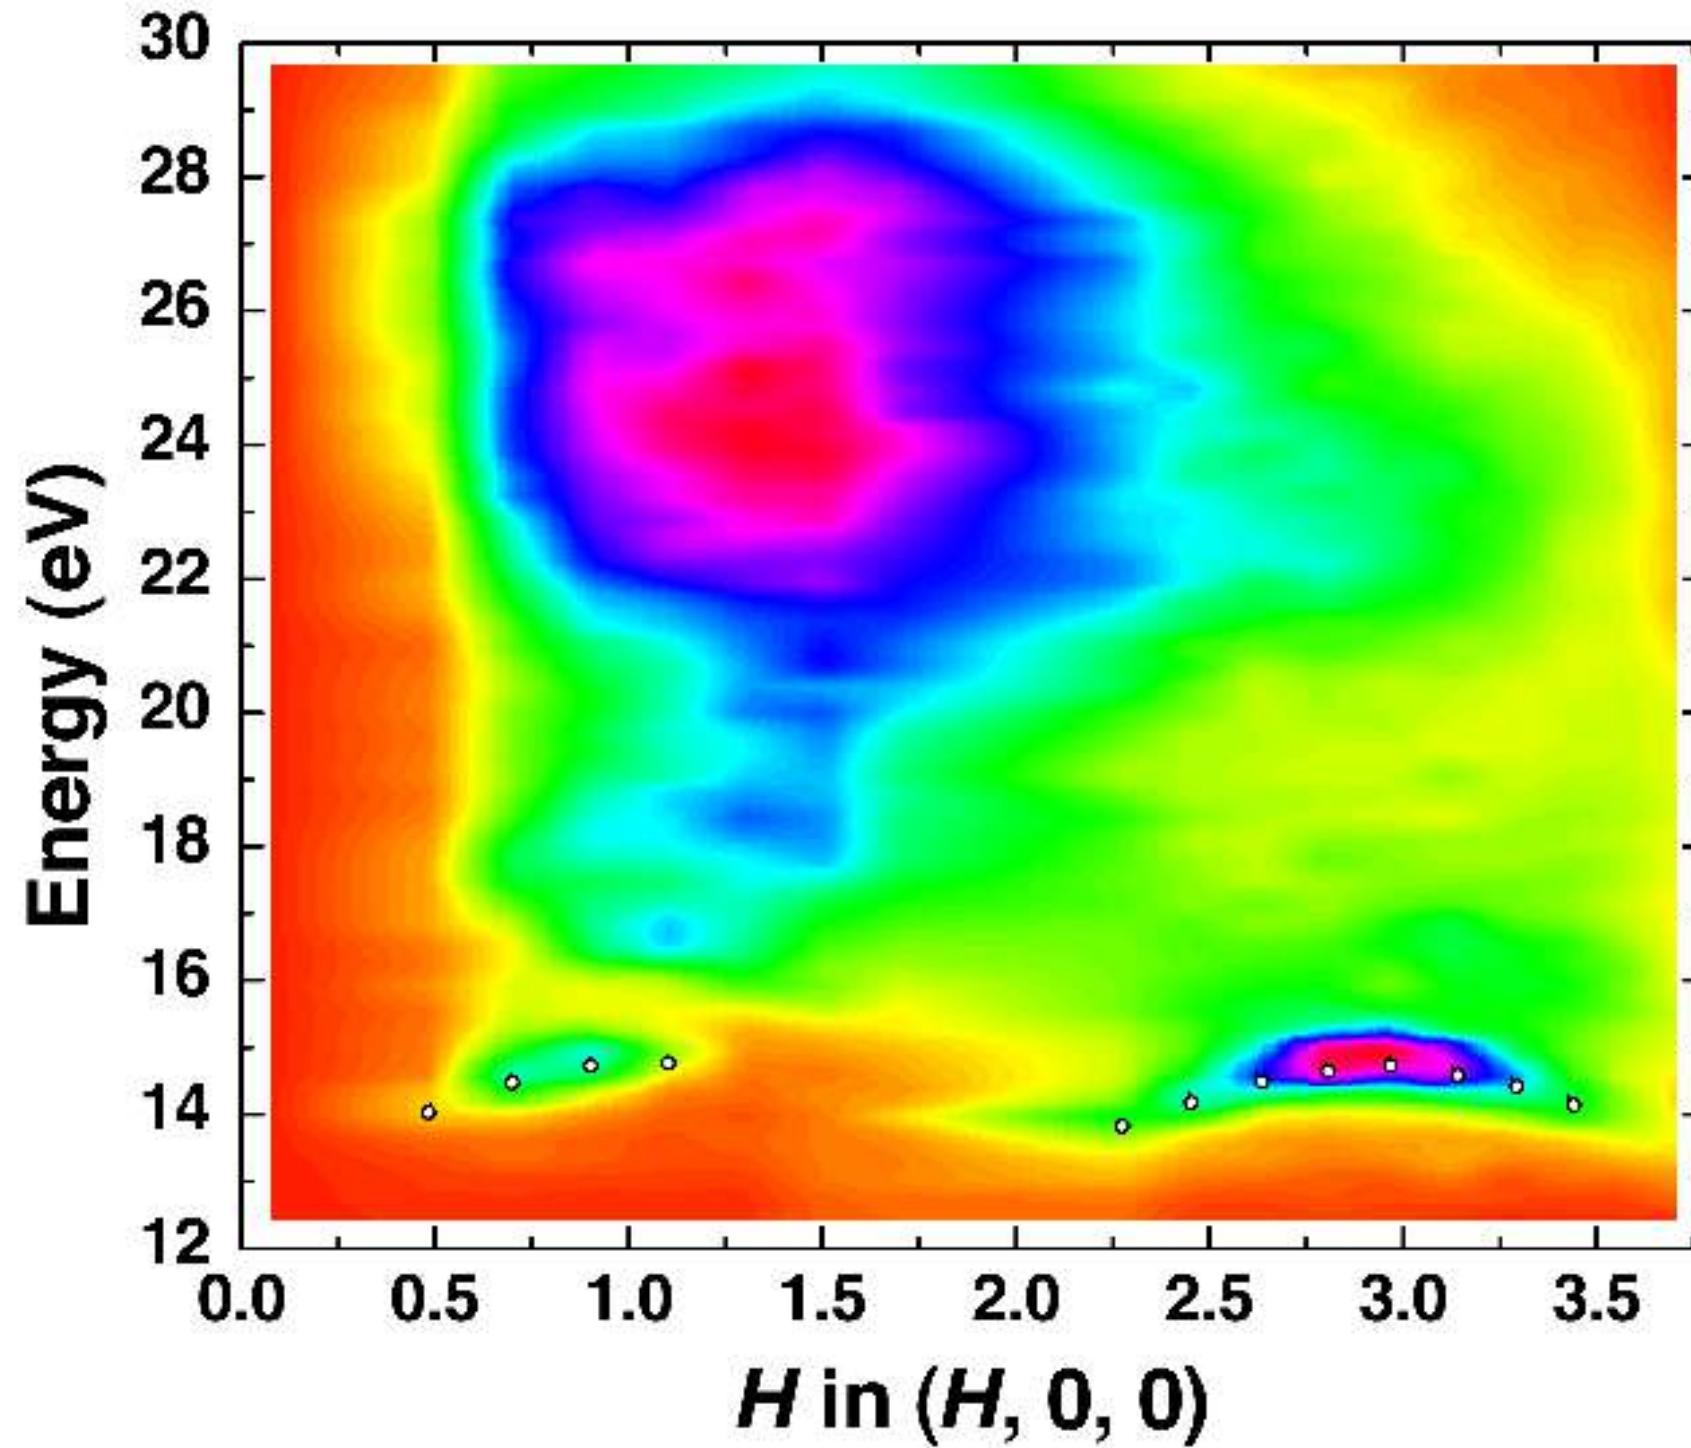

Absorption spectrum of LiF

Need to go beyond $\epsilon(\omega)$

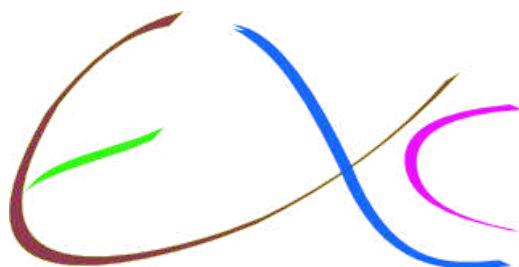

- full screening $\epsilon(q,\omega)$ is required in many-body physics (photoemission spectroscopy, band-gap, etc.) beyond RPA
- EELS, IXS are able today to give a full mapping of $\epsilon(q,\omega)$ crucially requiring a theoretical description

Bethe-Salpeter Equation extension (q)

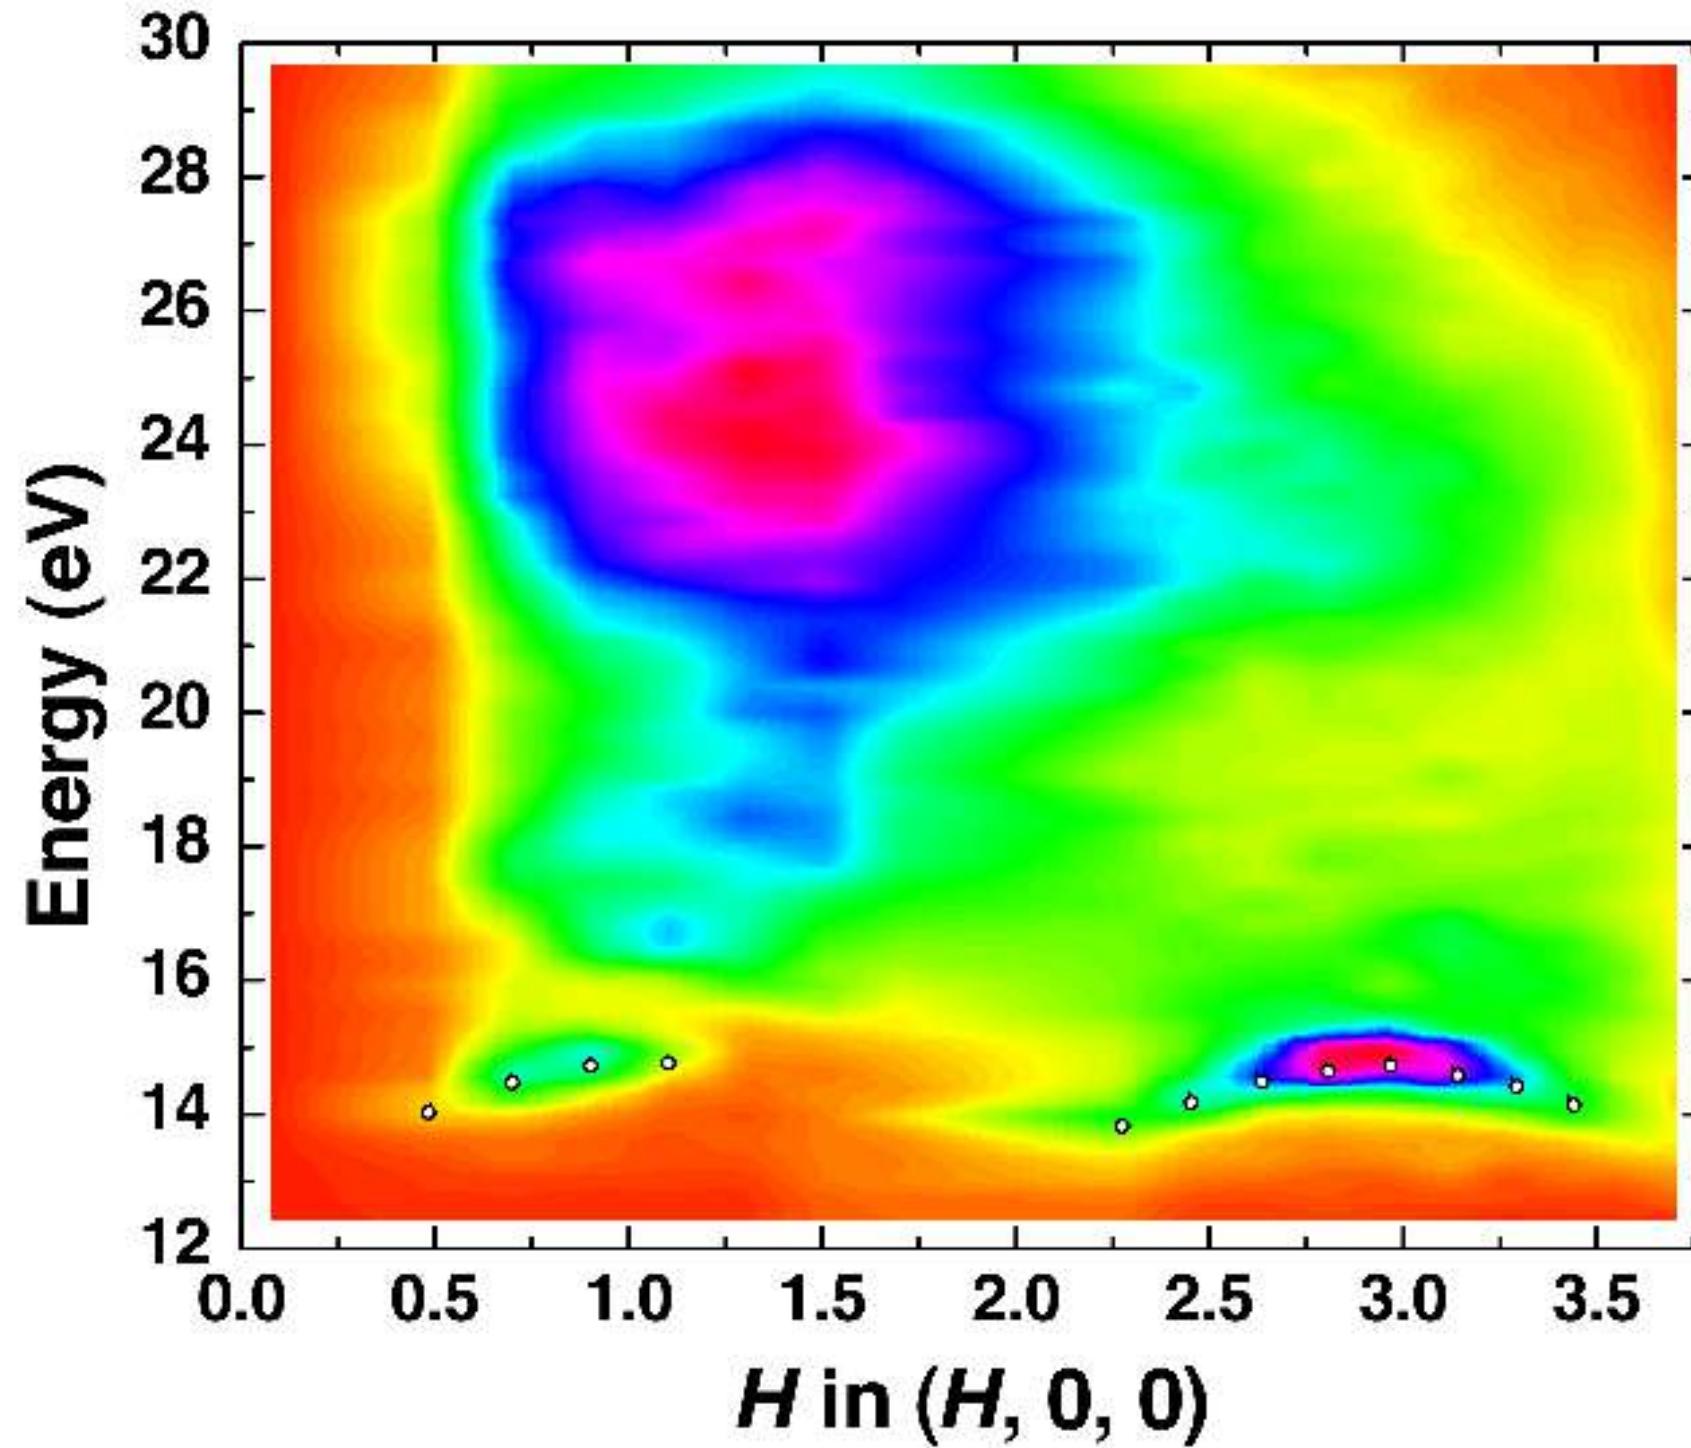

M. Gatti and F. Sottile PRB **88**, 85425 (2013)

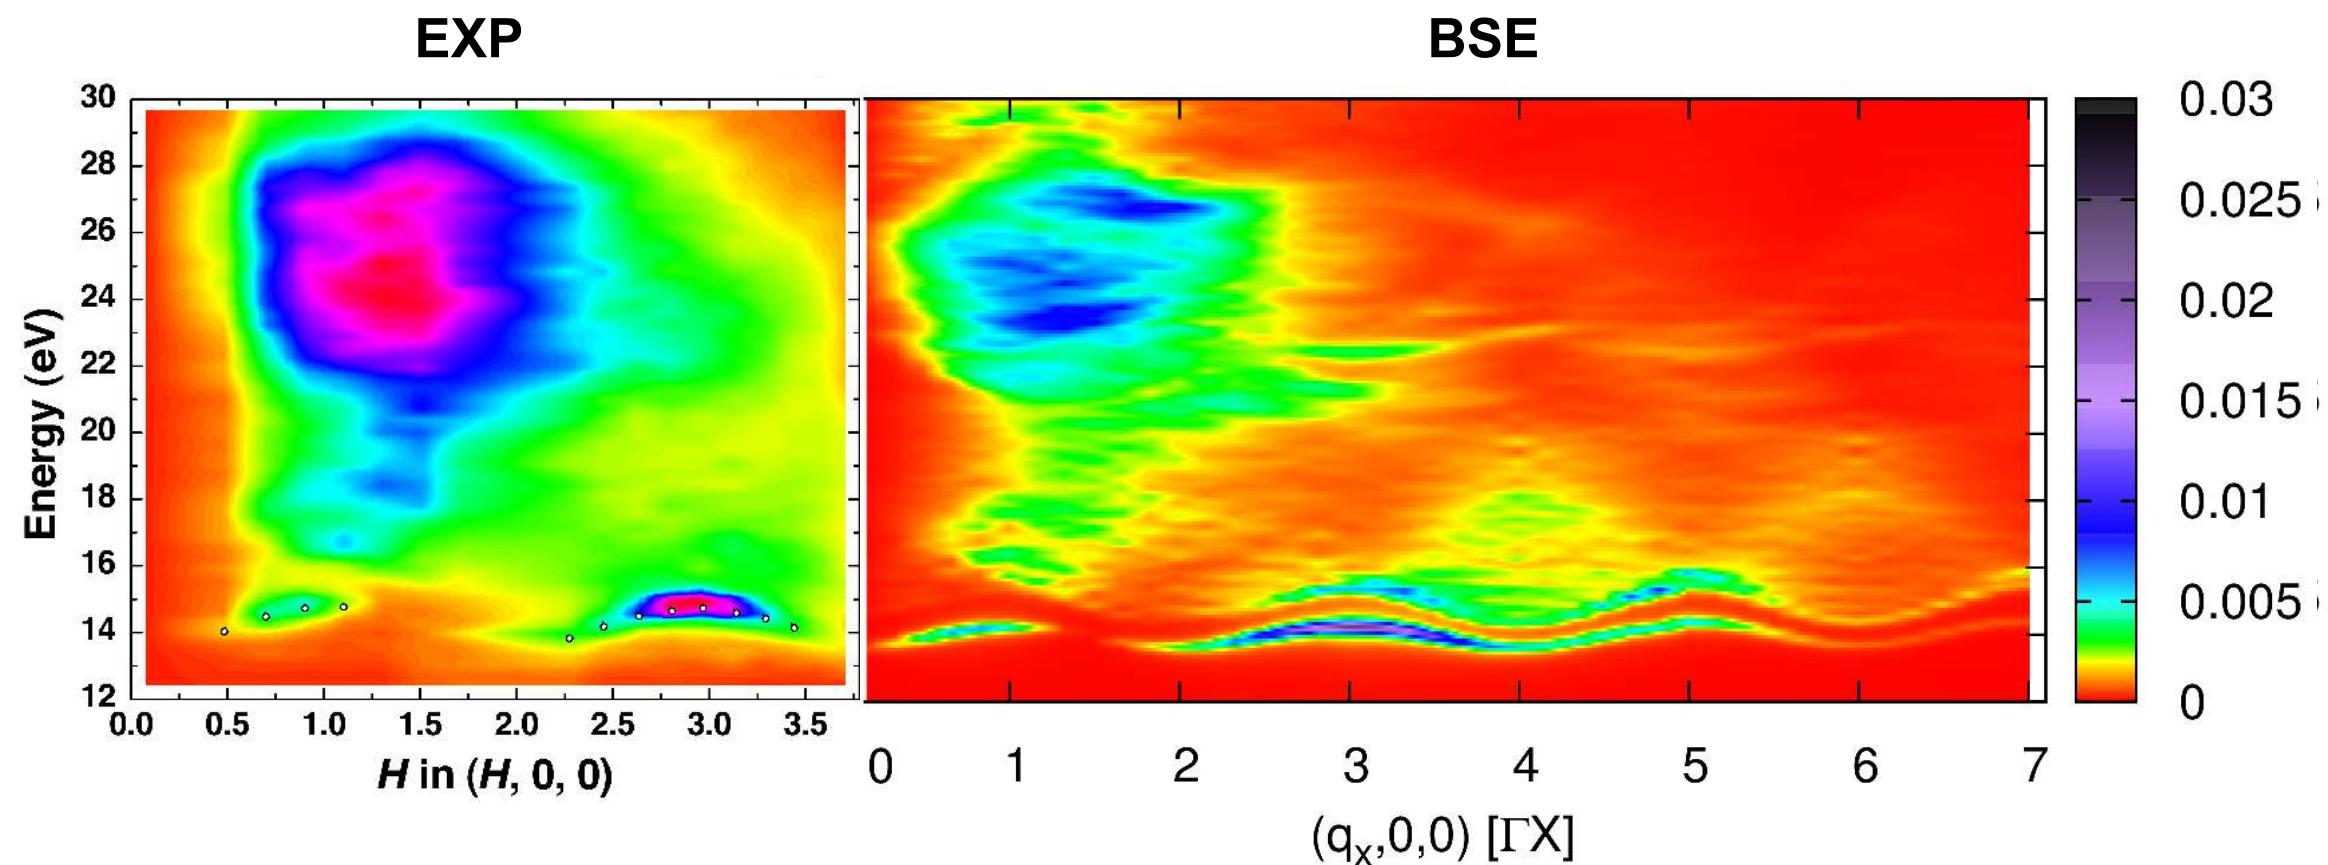

{ finite momentum transfer (beyond dipole)
quasi-particle wavefunctions
full coupling (beyond TDA)

Conclusions

- **Extension of BSE (q)**
- **Study several systems**
LiF, Ar, Molecular Solids
hBN, MoS₂, 2D systems
- **Excitonic effects in screening**
(exciton satellites in PES)
- **Other spectroscopies (CIXS, RIXS)**
